```
    else
      can :read, :all
    end
  end
end
```

We defined that the client can perform any action on his own products. The admin can perform any action on all products and the not logged in user can only read (look over) all products.

Next, we have to add this line of code to app/controllers/products_controller.rb file:

```
...1
  load_and_authorize_resource
...3
```

This method loads the resource into an instance variable and authorizes it automatically for every action in products_controller.rb. If the user is not able to perform the given action, the CanCan::AccessDenied exception is raised. Let's customize this exception by catching it and modifying its behavior. Add this piece of code to app/controllers/application_controller.rb:

```
...3
rescue_from CanCan::AccessDenied do |exception|
  redirect_to root_url, alert: exception.message
end
...7
```

We catch this exception, set the error message to flash, and redirect to the home page.

Now if you perform an action which a user is not able to perform, for example: remove admin product by client, you should get:

Conclusion
