```
    if user &&
user.authenticate(params[:password])
      session[:user_id] = user.id
      redirect_to root_url, notice: "Logged in!"
    else
      flash.now[:alert] = "Email or password is
invalid"
      render "new"
    end
  end
  def destroy
    session[:user_id] = nil
    redirect_to root_url, notice: "Logged out!"
  end
end
```

As you can see we use `session[:user_id]` to store the logged in user id. In case you haven't worked with sessions yet have a look at https://guides.rubyonrails.org/security.html#sessions

We need to put this code for the form in `app/views/sessions/new.html.erb` :

```
<p id="alert"><%= alert %></p>
<h1>Login</h1>
<%= form_tag sessions_path do |form| %>
  <div class="field">
    <%= label_tag :email %>
    <%= text_field_tag :email %>
  </div>
  <div class="field">
    <%= label_tag :password %>
    <%= password_field_tag :password %>
  </div>
  <div class="actions">
```
