CanCanCan is an authorization library which restricts what resources a given user is allowed to access. All permissions are defined in a single location (the Ability class).

Step 1. Create a new Rails application

I used 4.2.6 version of Rails and SQLite as a database. Let's skip a test and create a new Rails application.

```
$ rails new shop --skip-test-unit
$ cd shop
$ rake db:create
```

Step 2. Add Bootstrap and styles

Let's add a 'bootstrap-sass' gem to our Gemfile. After cleanups and adding this gem, your Gemfile should look like this:

```
source 'https://rubygems.org'

gem 'rails', '4.2.6'
gem 'sqlite3'
gem 'sass-rails', '~> 5.0'
gem 'uglifier', '>= 1.3.0'
gem 'coffee-rails', '~> 4.1.0'
gem 'jquery-rails'
gem 'turbolinks'
gem 'jbuilder', '~> 2.0'
gem 'sdoc', '~> 0.4.0', group: :doc
gem 'bootstrap-sass', '~> 3.3.6'

group :development, :test do
 gem 'pry-rails'
end

group :development do
 gem 'web-console', '~> 2.0'
 gem 'spring'
end
```

Then bundle everything:

```
$ bundle install
```
