Step 5. Add welcome page

First, create dashboard_controller.rb file under app/controllers folder. Add to this file:

```
class DashboardController < ApplicationController
  def index
  end
end
```

Next, create a dashboard folder under the app/views and create the index.html.erb file. Let's make this file looks like this:

index.html.erb

Now you have to open the routes.rb under the config folder. Clear file and add:

```
Rails.application.routes.draw do
  root 'dashboard#index'
end
```

Step 6. Start an application

Let's start our application.

Run this command in your terminal:

```
$ rails s
```

Now go to http://localhost:3000 in your browser.

Your application should look like:

Step 7. Create a product scaffold

Rails scaffolding is a quick way to generate some of the major pieces of an application.

Let's create a model, controller, and views for a product in a single operation.

```
$ rails generate scaffold Product name:string price:float
$ rake db:migrate
```

We created a Product which contains name and price.

Remove from app/views/products the below files, as we don't need them:
