pry-debugger

Fast execution control in Pry

Adds **step**, **next**, **finish**, and **continue** commands
and **breakpoints** to Pry using debugger.

To use, invoke pry normally. No need to start your script or app differently.

```
def some_method
  binding.pry           # Execution will stop here.
  puts 'Hello World'    # Run 'step' or 'next' in the
console to move here.
end
```

For a complete debugging environment, add pry-stack_explorer for call-stack frame navigation.

Execution Commands

step: Step execution into the next line or method. Takes an optional numeric argument to step multiple times.

next: Step over to the next line within the same frame. Also takes an optional numeric argument to step multiple lines.

finish: Execute until current stack frame returns.

continue: Continue program execution and end the Pry session.

Breakpoints

You can set and adjust breakpoints directly from a Pry session using the following commands:

break: Set a new breakpoint from a line number in the current file, a file and line number, or a method. Pass an optional expression to
