```
# GET /articles
# GET /articles.json
def index
  byebug
  @articles = Article.find_recent
  respond_to do |format|
    format.html # index.html.erb
    format.json { render json: @articles }
(byebug)

[1, 10] in /PathTo/project/app/controllers/articles_controller.rb

# GET /articles
# GET /articles.json
def index
  byebug
  @articles = Article.find_recent
  respond_to do |format|
    format.html # index.html.erb
    format.json { render json: @articles }
(byebug)
```

Inside any Rails application you can then invoke the debugger by calling the byebug method. Here's an example:

3.2 The Shell

As soon as your application calls the byebug method, the debugger will be started in a debugger shell inside the terminal window where you launched your application server, and you will be placed at the debugger's prompt (byebug). Before the prompt, the code around the line that is about to be run will be displayed and the current line will be marked by '=>', like this:
