The available variables are the same as if you were running the code line by line. After all, that's what debugging is.

You can also use up [n] and down [n] commands in order to change the context n frames up or down the stack respectively. n defaults to one. Up in this case is towards higher-numbered stack frames, and down is towards lower-numbered stack frames.

3.4 Threads

The debugger can list, stop, resume and switch between running threads by using the thread command (or the abbreviated th). This command has a handful of options:

thread: shows the current thread.
thread list: is used to list all threads and their statuses. The current thread is marked with a plus (+) sign.
thread stop n: stops thread n.
thread resume n: resumes thread n.
thread switch n: switches the current thread context to n.

This command is very helpful when you are debugging concurrent threads and need to verify that there are no race conditions in your code.

3.5 Inspecting Variables

Any expression can be evaluated in the current context. To evaluate an expression, just type it!

```
[3, 12] in /PathTo/project/app/controllers/articles_controller.rb
  12:
# GET /articles
# GET /articles.json
def index
  byebug
  @articles = Article.find_recent
  respond_to do |format|
    format.html # index.html.erb
```
