fortnights provided.
(byebug)
```

This is one of the best ways to find bugs in your code.
You can also use step n or next n to move forward n steps at once.

3.7 Breakpoints

A breakpoint makes your application stop whenever a certain point in the program is reached. The debugger shell is invoked in that line.

You can add breakpoints dynamically with the command break (or just b). There are 3 possible ways of adding breakpoints manually:

break n: set breakpoint in line number n in the current source file.
break file:n [if expression]: set breakpoint in line number n inside file named file. If an expression is given it must evaluated to true to fire up the debugger.
break class(.|\#)method [if expression]: set breakpoint in method (. and # for class and instance method respectively) defined in class. The expression works the same way as with file:n.
