Breakpoints

You can set and adjust breakpoints directly from a Pry session using the following commands:

break: Set a new breakpoint from a line number in the current file, a file and line number, or a method. Pass an optional expression to create a conditional breakpoint. Edit existing breakpoints via various flags.

Examples:

```
break SomeClass#run                 # Break at the start
of `SomeClass#run`.
break Foo#bar if baz?               # Break at `Foo#bar`
only if `baz?`.
break app/models/user.rb:15         # Break at line 15 in
user.rb.
break 14                            # Break at line 14 in
the current file.

break --condition 4 x > 2           # Change condition on
breakpoint #4 to 'x > 2'.
break --condition 3                 # Remove the condition
on breakpoint #3.

break --delete 5                    # Delete breakpoint
#5.
break --disable-all                 # Disable all
breakpoints.

break                               # List all
breakpoints. (Same as `breakpoints`)
break --show 2                      # Show details about
breakpoint #2.
```

Type `break --help` from a Pry session to see all available options.

breakpoints: List all defined breakpoints. Pass `-v` or `--verbose` to see the source code around each breakpoint.
