Body weight is the sum of bones, muscles, organs, body fluids and adipose tissue. All these components are subjected to normal changes as a reflection of growth, reproductive status, variation in exercise levels and the effects of aging. Maintaining a constant body weight is a complex system of neural, hormonal and chemical mechanism that keeps the balance between energy intake and energy expenditure within limits. In order to maintain an ideal body weight the calorie burnt out should be greater than the calorie consumption.

Nearly 40-50 million Indians belonging to upper middle class are overweight. With increasing numbers every years, obesity could become a public health problem in adults.

Obesity is a condition of excessive fatness either generalized or localized, resulting in an increase of more than 20 percent of the desirable body weight. WHO B defines obesity
