Peptic Ulcer Disease

Pathogenesis

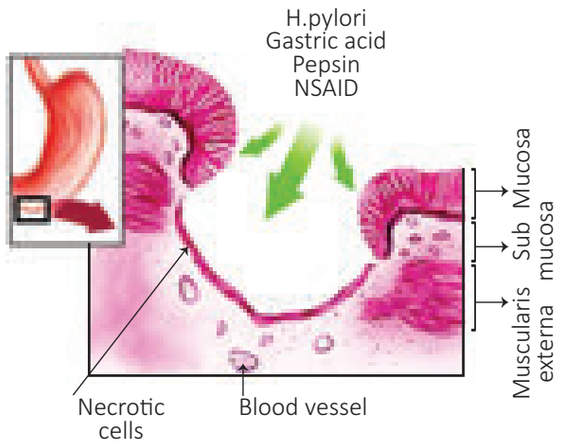

Fig 8.3 : Pathogenisis of Peptic Ulcer

The common symptoms are

- Abdominal pain
- Abdominal discomfort
- Nausea
- Vomiting
- Hematemesis (blood vomit)
- Heart burn
- Loss of appetite
- Weight loss
- Melena (dark and foul smelling stool)

COMPLICATIONS OF PEPTIC ULCER!

- Gastrointestinal bleeding
- Gastric outlet obstruction
- Perforation in the lining
- Penetration of ulcers
- Stomach Cancer

Activity : 5

Know the drugs!

List any five NSAIDs which are commonly present in medicine cabinet.

DO YOU KNOW?

Zollinger Ellison Syndrome

It is a type of cancer which releases gastrin hormone that causes excess acid production leading to peptic ulcer.

Goals for dietary and lifestyle management

- To restore good nutritional status
- To reduce the signs and symptoms of ulcer
- To neutralize acids
- To decrease the acid secretion
- To preserve the epithelial lining of the GI tract to the destructive action of gastric juices

Dietary principle

Adequate calorie, high protein, adequate fat, adequate carbohydrates, low fibre, adequate fluid and bland diet is prescribed for the patients. Vitamins and Minerals are given as per the prescribed daily requirement of the individual.

Diet therapy for Peptic Ulcer

It is important to provide rest to the affected area and support tissue healing. The key to the management of peptic ulcer is the judicious choice of drug therapy and dietary modifications.

Good nutritional status and good dietary regime can help in reducing the impact of the disease on the overall wellbeing of the patient.

Energy

Adequate energy should be taken to maintain the ideal body weight of the patient and to prevent weight loss and spare the proteins for healing the ulcer.

Protein

High protein intake ensures synthesis of new tissues essential for healing. Milk protein is valued for its buffering action. The buffering action is effective only for 20-60 minutes
