

DIET IN DIABETES MELLITUS

CHAPTER 9

OBJECTIVES

- Know the prevalence of Diabetes in India.
- Learn about the types of Diabetes.
- Understand the signs, symptoms and metabolic changes in Diabetes.
- Understand the diagnosis and complications of Diabetes..
- Know about the treatment of diabetes.
- Understand the significance of lifestyle modifications in managing Diabetes.

KFMCH7

Diabetes mellitus is a chronic disease in which the body's ability to produce or respond to the hormone insulin is impaired, resulting in abnormal metabolism of carbohydrates and elevated levels of glucose in the blood. Diabetes is no longer a dreaded disease; a well managed diabetic has a good life expectancy.

Diabetes mellitus is a metabolic disorder that prevents the body to utilize glucose completely or partially. It is characterized by raised glucose concentration in the blood and alterations in carbohydrate, fat and protein metabolism. This can be due to failure in the formation of insulin or liberation or action.

9.1. Prevalence of Diabetes

Diabetes mellitus is a serious metabolic disease, affecting people of all geographic, ethnic or racial origin and its prevalence is increasing globally. Burden from this costly disease is high on the low and middle income countries (LMIC) where the impacts of modernization and urbanization have caused marked adverse changes in lifestyle parameters.

In 2013, of the estimated 382 million people with diabetes globally, more than 80 per cent lived in LMIC. It was estimated that India had 65.1 million adults with diabetes in 2013, and had the 2nd position among the top 10 countries with the largest number of diabetes. This number is predicted to increase to 109
