

DO YOU KNOW?

An Insulin pump administers insulin through a catheter in the abdomen to help control a person's blood sugar levels.

9.7.3. Oral Hypoglycaemic drugs

Action of oral anti diabetic drugs in controlling the blood sugar levels may be due to:

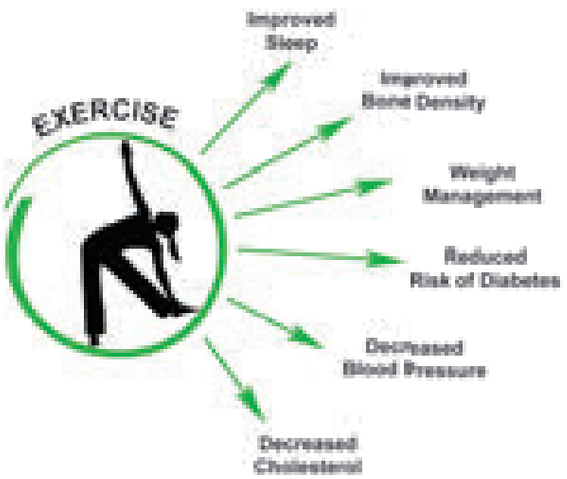

- ❖ Stimulation of insulin production from beta cells of Langerhans.
- ❖ Effect in making circulating insulin more effective.
- ❖ Action on intestinal mucosa decreasing the rate of absorption of glucose.
- ❖ Acting directly on peripheral muscle tissue increasing utilization of glucose.

Some of the common oral hypoglycaemic drugs are Biguanides and Sulphonylureas.

9.7.4. Exercise

Regular physical activity affects overall glycemic control through improved insulin sensitivity, lowered insulin requirements, and improved glucose tolerance. Collectively, these health benefits may contribute to a reduction in the risk for long-term diabetes complications, slow the progression of existing complications and enhance quality of life. In addition, exercise is known to reduce stress and strain and enhance the quality of life.

Benifits of Exercise for Diabetics
