organisation may be dreamt and that there can be public delusions.

The variety of ideas is explained by the notion of a storehouse consciousness (***alaya-vijnana***).

Vikalpa (conceptual thought): for Buddhists following ***Dignaga*** and ***Dharmakirti***, *vikalpa* means a concept that we construct out of the data of sensory awareness. Sense perception grasps unique particulars (***svalakshana***) lasting only for a moment. Only the unique particulars are real because they alone are causally effective. Cognitions involving apparently shared features of objects are conceptual interpretations based on experiences of particulars. Objective reality is strictly ineffable, since it includes no general features. It causes experiences, although their subjective content (*vishaya*) does not mirror it. But to find our way around successfully, we need to make discriminations using concepts and words. Some concepts, and elaborated conceptual schemes, apply more adequately than others to objective reality: that is, they work better for us in leading to successful activity. *Vikalpas* interpret and organise the data of perceptual experiences, making them intelligible and serviceable. This sort of conceptual construction differs from the free play of imagination, which is not in touch with objective reality. Conceptual construction depends upon the objective realm even if the ways in which our minds work do not accurately represent the way things are when left to themselves. Conceptualisation involves generalisations and there are no objective generalities. The store of human concepts, built up from impressions derived from a beginningless series of previous experiences, is transmitted down the generations
