PHP Function and Array

LEARNING OBJECTIVES

- To understand the importance of Functions in PHP
- To know the types of functions in PHP
- To know the basics of array
- To know the types of Arrays in PHP

PHP Function and Array

In PHP server side scripting language Functions and array concepts are very important to solve the many complex problems in real world.

DO YOU KNOW?

PHP has over 700 functions built in that perform different tasks. Built in functions are functions that exist in PHP installation package.

Functions in PHP

In most of the programming language, a block of segment in a program that perform specific operations like (Insert, Execute, Delete, Calculate, etc.). This are known as Functions. A Function is a type of sub routine or procedure in a program. A Function will be executed by a call to the Function and the Function returns any data type values or NULL value to called Function in the part of respective program.

Functions can be divided in to three types:

- User defined Function,
- Pre-defined or System or built-in Function, and
- Parameterized Function.

User Defined Function

User Defined Function (UDF) in PHP gives a privilege to user to write their own specific operation inside of existing program module. Two important steps the Programmer has to create for users define Functions are:

Function Declaration

A user-defined Function declaration begins with the keyword "function". User can write any custom logic inside the function block.

SYNTAX:

function *functionName*()

{

Custom Logic code to be executed;

}
