5.2.3 Multidimensional Arrays

A multidimensional array is an array containing one or more arrays.PHP understands multidimensional arrays that are two, three, four, five, or more levels deep. However, arrays more than three levels deep are hard to manage for most people.

Example:

```
<?php
// A two-dimensional array
$student=array
 (
 array("Iniyan",100,96),
 array("Kavin",60,59),
 array("Nilani",1313,139)
 );

echo $$student[0][0].": Tamil Mark: ".$student [0][1].". English mark: ".$student [0]
[2]."<br>";
echo $$student[1][0].": Tamil Mark: ".$student [1][1].". English mark: ".$student [1]
[2]."<br>";

echo $$student[2][0].": Tamil Mark: ".$student [2][1].". English mark: ".$student [2]
[2]."<br>";
?>
```

POINTS TO REMEMBER

- In PHP Functions Reduce duplication of code
- In PHP Functions Decompose complex problems into simpler pieces
- In PHP Functions Improve clarity of the code
- In PHP Functions Reuse code
- In PHP Functions hide Information
- In PHP arrays use Foreach looping concept

GLOSSARY

Functions	A function is that they are reusable; if you have a task that needs to be performed a number of times, a function is an ideal solution.
User defined Function	Besides the built-in PHP functions, we can create our own functions. A function is a block of statements that can be used repeatedly in a program.
