

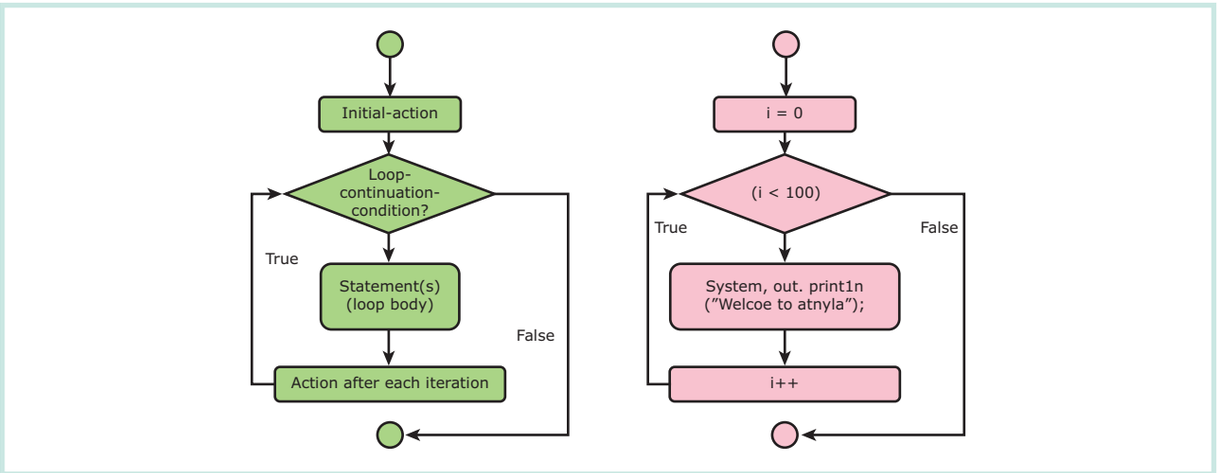

Figure 7.1 Flowchart of For loop Structure and Flow chart

Example:

```
<?php
for ($i = 0; $i<= 10; $i++) {
   echo "The number is: $i<br>";
}
?>
```

Foreach Loop:

foreach loop is exclusively available in PHP and is mainly used for looping through the values of an array. The loop iteration deepens on each KEY Value pair in the Array. For each, loop iteration the value of the current array element is assigned to $value variable and the array pointer is advanced by one, until it reaches the end of the array element. Refer Figure 7.2.

Syntax:

```
foreach ($array as $value) {
code to be executed;
}
```

SWVLHT

```
seq = [18, 20, 32]
foreach x of seq
print x
end
```

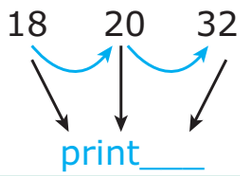

Figure 7.2 Foreach loop Structure and Flow

The foreach construct provides an easy way to iterate over arrays. foreach works only on arrays and objects, and will issue an error when you try to use it on a variable with a different data type or an uninitialized variable.
