

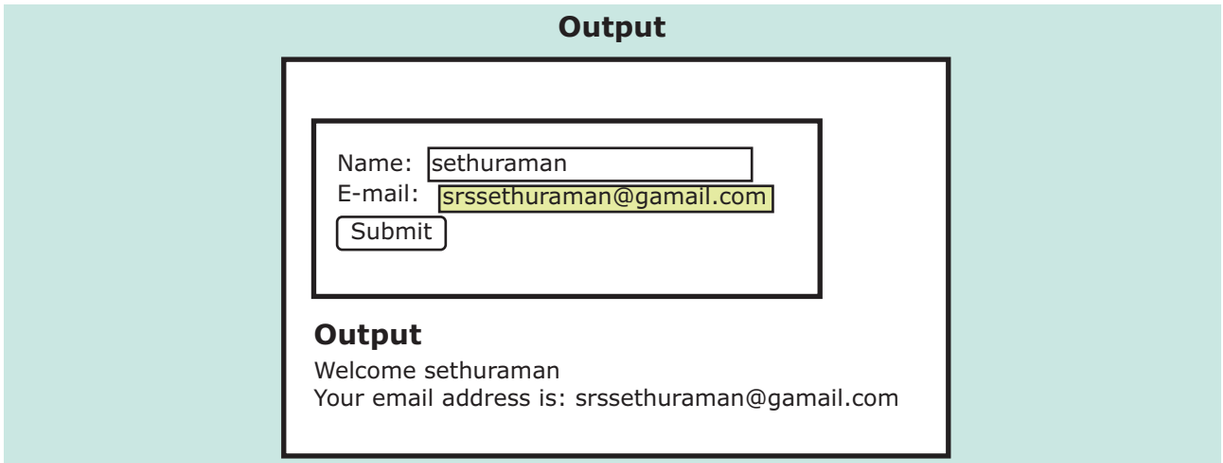

Figure 8.2 Login module

- In the above example the HTML File contains two Text Box (Name and Email), One Button and one form tag. The remote server PHP file (welcome. php) is mentioned in form tag under the Action Attribute.
- In "Welcome.Php" file, PHP variables such as $_POST and $_GET collects the data and prepares the response accordingly.
- Eventually the user will receive the output response in the client machine's browser screen.

8.1.2 Basic PHP Form Validation

Validation is a process of checking the input data submitted by the user from client machine. There are two types of validation available in PHP. They are as follows,

Client-Side Validation: The input data validations are performed on the client machine's web browsers using client side scripts like Java script or adding "required" attribute in HTML input tags.

Server Side Validation: After the submission of data, validations are performed on the server side using the programming like PHP, ASP or JSP etc. available in the server machine.

A HTML form will take input from the site visitor and then will post it to a back-end application such as CGI, ASP Script or PHP script etc. The back-end application will perform required processing on the passed data based on defined business logic inside the application.

Validation rules for HTML input field

Name (Text Input)	:	Must contain letters and white-spaces
Email (Text Input)	:	Must contain @ and .strings
Website (Text Input)	:	Must contain a valid URL
Radio	:	Must be selectable minimum one value
Check Box	:	Must be checkable minimum one value
Drop Down menu	:	Must be selectable minimum one value
