maintenance and include ICMP and SNMP.

11.1.1 Internet/Intranet/ Extranet

INTERNET: The **Internet**, "the Net," is a worldwide system of computer networks- A network of networks where the users at any one computer can, if they have permission, get information from any other computer. The Internet is a network of global connections – comprising private, public, business, academic and government networks – linked by guided, wireless and fiber-optic technologies. It was perceived by the Advanced Research Projects Agency (ARPA) of the U.S. government in 1969 and was first recognized as the ARPANet. The unique aim was to generate a network that would permit users of a research computer from one university to "talk to" research computers on other universities. The jargons Internet and World Wide Web are frequently used interchangeably, but they are not precisely the same. The Internet denotes to the global communication system, including infrastructure and hardware, whereas the web is one of the services interconnected over the Internet. See Figure 11.1

INTRANET: It is a private network within an enterprise to share company data and computing resources between the employees. It may consist of many interlinked local area networks. It includes connections through one or more gateway (connects two networks using different protocols together known as protocol convertor) computers to outside Internet. See Figure 11.2

Figure 11.2 Intranet

EXTRANET: It is a private network that uses Internet technology and the public telecommunication system to securely share business's information with suppliers, vendors, partners, customers, or other businesses. See Figure 11.3 and 11.4
