### 11.1.2 Mobile Networks

A mobile network or cellular network as it is made up of a large number of signal areas called cells. These cells join to form a large coverage area. Users can cross into different cells without losing their connection. Within each cell there is a base station, which sends and receives the mobile signals. A mobile device will connect to the nearest or least base station. The base stations are connected to digital exchange where the communication is sent to other telephone
