

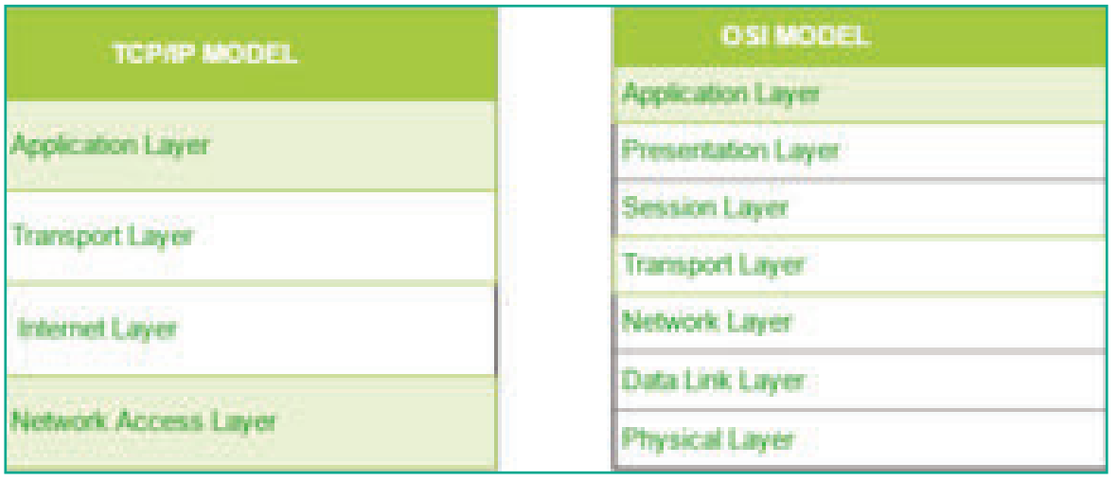

Figure 11.11 Network Layers

In layman's terms, HTTPS gurantees that users watch websites that they want to watch. Data exchanged between the user and the website is not read, stolen or tampered by a third party. But it can't encrypt everything - it has some limitations too. For example, HTTPS can't encrypt host addresses and port numbers.

TCP/IP procedures are based on a layered framework. TCP/IP has four layers. See Figure 11.12

Network Interface Layer

It is the bottommost level layer. It is comparable to that of the Open System Interconnection Physical and Data Link layers. Different TCP/IP protocols are being used at this layer, Ethernet and Token Ring for local area networks and protocols such as X.25, Frame Relay, and ATM for wide area networks. It is assumed to be an unreliable layer.

Network Layer

It is the layer where data is addressed, packaged, and routed among networks. The important Internet protocols that operate at the Network layer are:
