Network Cabling

LEARNING OBJECTIVES

- To know the necessity of cabling in computer networking.
- To know the different types of cables used in networking.
- To know the components involved in making of Ethernet cable.
- To know the various types of Registered Jacks and its functions
- To know the wiring and colour coding techniques used in Ethernet cabling.
- To practice in making an Ethernet cable with desired length.

13.1 Introduction

Once the basics of computer was invented by Charles Babbage, people started inventing much newer technology compatible with the computer. In the 19th Century the US military base had much technology to serve weapons and people but they did not have any technology to send a report from one place to another. Then slowly the word network grew bigger and bigger. Then the Advanced Research Projects Agency Network (ARPANET) was invented and the TCP/IP was adopted with ARPANET. Then the researchers began to research the "network of networks".

First the network was within one computer to another computer, then it moved to one place to another place, then one city to another, then slowly it grew up and became one as Internet. The essential service of Internet is WWW (World Wide Web) which was invented by Tim Berners Lee. Internet can be accessed easiliy from anywhere but the setting up of the network is a big nightmare. Still network cables are being used worldwide to produce a faster Internet to the people. The network cables are used to transfer the data from one device to another device.
