Open Source Concepts

LEARNING OBJECTIVES

To know the

- Need of Open Source Software.
- NS2 and its Use
- OpenNMS and Group which created OpenNMS
- OpenSource Hardware

14.1 Introduction

Free software and compilers were provided with early computer hardware. With these human understandable code the user can modify, add new code and identify the errors.

Can anyone change the codes in open source software?

Open source software has been developed by a variety of programmers. However, to add a new change to the software,the modified code will be submitted to a group of dedicated programmers. These programmers then test the modified codes and if it satisfies the appropriate rules, it will then be distributed to all.

Why it is called open source?

Open Source simply refers to making the source code of the software freely available for users or other developers to use and make changes into the original repository or fork the project into and build a new one. Open source software is usually created and updated by many programmers around the world and made freely accessible. Proprietary software is owned by an organization or individual. The makers of proprietary software have not allowed the users or other developers to view or edit the source code. But the advantage of the proprietary software is that it gives more control, support, training, security and stability for user making the software reliable to the users

In a network it is not easy to find problems. Especially when there are more systems are connected, the complexity is more, so we need Network Software to Control, Analyse the Server, System, protocol, Network, Traffic flow and reports about ups and downs of network parts. Notification help the user and administrator easily find working status of network systems and hardware, alert message, give details of faults, where and when it happens.
