Step 5:

Webserver's configuration setting file "httpd.conf" is located in the **conf** directory under the apache installation directory. Edit this file and enable the PHP module to run PHP scripting language.

4.6 Web Development Concept

Web development concept describes in detail about Website development and hosting through network (Internet/Intranet). The process of development also includes Web content generation, Web page designing, Website security and so on.

4.6.1 How PHP Script Work

Website or Web page is developed by the programmer using PHP script. Finally the entire Website codes are moved to Web server path in a remote server machine.

From client side, the end user opens a browser, types the URL of the Website or Webpage and initiates the request to remote server machine over the network.

After receiving the request from client machine the Web server tries to compile and interpret the PHP code which is available in remote machine. Next a response will be generated and sent back to the client machine over the network from Webserver.

Finally the browser which is installed in the client machine receives the response and displays the output to user, as shown in Figure 4.8

4.6.2 PHP Syntax

PHP uses three diffrents types of Syntax. They are as follows

1. Default Syntax
2. Short open Tags
3. HTML Script embed Tags
