```
end
```

When autoloading is involved that plot has a twist. Let's consider:

```
class C < BasicObject
  def user
    User # WRONG
  end
end
```

Since Rails checks the top-level namespace `User` gets autoloaded just fine the first time the `user`method is invoked. You only get the exception if the `User` constant is known at that point, in particular in a *second* call to `user`:

```
c = C.new
c.user # surprisingly fine, User
c.user # NameError: uninitialized constant C::User
```

because it detects that a parent namespace already has the constant (see Qualified References).

As with pure Ruby, within the body of a direct descendant of `BasicObject` use always absolute constant paths:

```
class C < BasicObject
  ::String # RIGHT

  def user
    ::User # RIGHT
  end
end
```
