```
Rails.application.routes.draw do
  get 'welcome/index'

  # The priority is based upon order of creation:
  # first created -> highest priority.
  #
  # You can have the root of your site routed with "root"
  # root 'welcome#index'
  #
  # ...
```

This is your application's *routing file* which holds entries in a special DSL (domain-specific language)that tells Rails how to connect incoming requests to controllers and actions. This file contains many sample routes on commented lines, and one of them actually shows you how to connect the root of your site to a specific controller and action. Find the line beginning with `root` and uncomment it. It should look something like the following:

```
root 'welcome#index'
```

`root 'welcome#index'` tells Rails to map requests to the root of the application to the welcome controller's index action and `get 'welcome/index'` tells Rails to map requests tohttp://localhost:3000/welcome/index to the welcome controller's index action. This was created earlier when you ran the controller generator (`rails generate controller welcome index`).

Launch the web server again if you stopped it to generate the controller (`rails server`) and navigate to http://localhost:3000 in your browser. You'll see the "Hello, Rails!" message you put into `app/views/welcome/index.html.erb`, indicating that this new route is indeed going to `WelcomeController`'s `index` action and is rendering the view correctly.

For more information about routing, refer to Rails Routing from the Outside In.

5 Getting Up and Running

Now that you've seen how to create a controller, an action and a view, let's create something with a bit more substance.

In the Blog application, you will now create a new *resource*. A resource is the term used for a collection of similar objects, such as articles, people or animals. You can create, read, update and destroy items for a resource and these operations are referred to as *CRUD* operations.

Rails provides a `resources` method which can be used to declare a standard REST resource. You need to add the *article resource* to the `config/routes.rb` as follows:

```
Rails.application.routes.draw do

  resources :articles

  root 'welcome#index'
end
```

If you run `rake routes`, you'll see that it has defined routes for all the standard RESTful actions. The meaning of the prefix column (and other columns) will be seen later, but for now notice that Rails has inferred the singular form `article` and makes meaningful use of the distinction.

```
$ bin/rake routes
      Prefix Verb   URI Pattern                  Controller#Action
    articles GET    /articles(.:format)          articles#index
             POST   /articles(.:format)          articles#create
 new_article GET    /articles/new(.:format)      articles#new
edit_article GET    /articles/:id/edit(.:format) articles#edit
     article GET    /articles/:id(.:format)      articles#show
             PATCH  /articles/:id(.:format)      articles#update
             PUT    /articles/:id(.:format)      articles#update
             DELETE /articles/:id(.:format)      articles#destroy
        root GET    /                            welcome#index
```
