Review Questions

1. What is meant by “First-Generation Drones,” and during which period where they developed?
2. Describe the fundamental purpose behind the development of early unmanned aerial vehicles (UAVs).
3. Define the basic characteristics of first-generation drones in terms of design and control.
4. How did early drone technology differ from modern UAV systems?
5. What role did early aviation materials play in the construction of first-generation UAVs?
6. Explain why first-generation drones are considered the foundation of modern UAV technology.
7. What were the primary limitations of early drone flight control systems?
8. Why was manual radio control essential to first-generation drone operations?
9. Discuss how tethered balloons and kites contributed to the early concepts of unmanned aerial observation.
10. How did Nikola Tesla’s experiments in wireless control influence UAV technology?
11. What was the significance of early aerial observation methods in shaping UAV design philosophy?
12. Identify the major differences between passive aerial systems (like kites) and powered early UAVs.
13. What technological developments made the transition from manned to unmanned aircraft possible?
14. Summarize the key historical stages in the development of first-generation drones.
