- *Propulsion*: Pratt and Whitney PT6A-67A turboprop engine
- *Payload capacity*: 1000+ kg
- *Sensors*: EO/IR, SAR/GMTI, ELINT, COMINT, maritime radar
- *Control system*: SATCOM and LOS dual-link communication
- *Primary roles*: ISR, target acquisition, border and maritime patrol, communication relay

Figure 4.5 illustrates the Heron TP (Eitan), a medium-altitude, long-endurance UAV developed by Israel Aerospace Industries (IAI) in 2004. The diagram highlights its key structural components, including the twin-boom fuselage, pusher turboprop engine, and electro-optical/infrared (EO/IR) turret mounted under the forward fuselage. The long, slender wings with winglets enhance aerodynamic efficiency, while the tricycle landing gear ensures smooth autonomous take-off and landing. The twin vertical stabilizers, bearing the Israeli Air Force insignia, provide directional stability during extended missions. This configuration allows the Heron TP to achieve remarkable endurance exceeding 36 hours and to carry multiple payloads, including SAR, ELINT, and COMINT sensors. The figure effectively captures the aircraft's optimized design for strategic surveillance, reconnaissance, and intelligence operations, underscoring its role as a cornerstone of Israel's UAV technology leadership.
