- *Endurance*: ~3 hours
- *Payload*: 2 × 250 kg-class smart bombs (internal bay)
- *Control system*: Autonomous flight management with ground supervision
- *Stealth features*: Radar-absorbent materials, internal weapon bay, low IR signature

Figure 4.6 illustrates the Dassault Neuron, a European stealth unmanned combat aerial vehicle (UCAV) designed for autonomous strike operations. The labeled diagram highlights its angular, radar-absorbing airframe, internal weapons bay, and single Rolls-Royce Turbomeca Adour engine, which provides subsonic thrust while minimizing infrared and radar signatures. The autonomous flight control system, connected via a ground-based interface, allows the Neuron to operate independently from take-off to landing. The figure effectively demonstrates the integration of stealth, autonomy, and precision, showcasing how the Neuron's sleek flying-wing design and advanced avionics mark a pivotal step toward the next generation of unmanned combat air systems (UCAS) in Europe.
