4.5.2.6 BAE Systems Taranis (2010)

The BAE Systems Taranis, unveiled in 2010, is a cutting-edge stealth unmanned combat aerial vehicle (UCAV) demonstrator developed by BAE Systems (United Kingdom) in collaboration with the UK Ministry of Defense (MoD). It was designed to explore autonomous flight, stealth technology, and advanced mission management systems for future combat applications. Named after Taranis, the Celtic god of thunder, the UAV symbolizes power and technological prowess, representing the United Kingdom's commitment to developing indigenous capabilities in next-generation unmanned warfare (Oxford, 2016).

The Taranis project was a key part of the United Kingdom's strategic unmanned air vehicle (SUAV) program, and its successful demonstration positioned the United Kingdom among the few nations capable of producing stealth UCAVs. It served as a testbed for autonomous mission control, low-observable aerodynamics, and intelligent weapon systems,
