- *Stealth features*: RAM coatings, shielded air intakes, infrared signature suppression
- *Control system*: Fully autonomous with human supervision

Figure 4.7 presents the BAE Systems Taranis, a stealth unmanned combat aerial vehicle (UCAV) designed to demonstrate autonomous operation and low-observable technologies. The labeled diagram highlights key structural features, including the flying-wing configuration, internal weapons bay, shielded air intake, and turbofan engine, which collectively minimize radar and infrared signatures. The figure also indicates the real-time analysis and communication systems, underscoring the UAV's autonomous mission management capability. The smooth, angular airframe illustrates the aircraft's stealth-optimized geometry, while the retractable landing gear supports fully autonomous takeoff and landing.
