Figure 5.6 depicts the Boeing Airpower Teaming System (ATS), an autonomous, stealth-optimized UAV designed for AI-driven manned–unmanned teaming. The labeled diagram highlights its modular nose section, which can house different mission payloads, and its stealth-optimized fuselage, engineered to minimize radar cross-section. The figure also shows the AI mission network, which enables coordination with manned aircraft such as the F/A-18 Super Hornet and P-8 Poseidon, illustrating its role as a "loyal wingman" platform. Through its AI-based mission management, the ATS performs reconnaissance, electronic warfare, and combat support operations autonomously. This figure captures the system's core innovation, a fusion of autonomy, modularity, and collaborative intelligence that positions it as a key milestone in fourth-generation UAV development.

5.6.2.5 FCAS (Future Combat Air System) (2021)

The Future Combat Air System (FCAS), launched in 2021, is an ambitious European next-generation air dominance program jointly developed by Dassault Aviation (France), Airbus Defense and Space (Germany), and Indra Sistemas (Spain). It represents a monumental step in the evolution of
