Labeled sections indicate the internal weapons bay, which allows for precision-guided munitions storage while preserving stealth, and the AI-driven autonomy architecture, which governs flight control, target acquisition, and adaptive mission execution. The absence of vertical stabilizers and the inclusion of a serpentine engine inlet further demonstrate its stealth-oriented aerodynamics. This figure encapsulates India's leap into fourth-generation UCAV technology, merging indigenous engineering with AI autonomy for deep-strike, reconnaissance, and suppression of enemy air defense missions.

5.6.2.8 Okhotnik-B (Hunter-B) (2020)

The Okhotnik-B (Hunter-B) is a large, stealthy Russian unmanned combat aerial vehicle (UCAV) demonstrator developed by Sukhoi/United Aircraft Corporation and first publicly flown in test form around 2019–2020. Designed as a heavy, long-range, low-observable platform, Okhotnik-B follows a blended flying-wing architecture that minimizes radar cross-section and supports internal payload carriage. It is intended to operate both independently and in manned–unmanned teaming roles alongside advanced
