Figure 6.3 KF-21 Boramae (2021).⏎

The diagram also demonstrates the KF-21's AI-assisted avionics and sensor fusion capabilities, which integrate data from radar, IR sensors, and targeting pods to enhance pilot situational awareness. Future upgrades labeled on the airframe represent planned internal weapon integration, enhanced electronic warfare (EW) systems, and AI-driven semi-autonomous flight operations envisioned in the Block III variant.

6.5.2.4 Sukhoi S-70 Okhotnik – 2020

The Sukhoi S-70 Okhotnik, also known as Okhotnik-B ("Hunter"), is Russia's first heavy stealth unmanned combat aerial vehicle (UCAV), developed by Sukhoi in collaboration with the United Aircraft Corporation (UAC). Officially revealed in 2020, the Okhotnik represents a major step forward in Russia's fifth-generation airpower strategy, designed to operate in coordination with the Su-57 Felon fighter jet under a manned–unmanned teaming (MUM-T) framework. Its primary mission roles include long-range precision strike, reconnaissance, and electronic warfare, forming the foundation for AI-assisted autonomous combat operations in future Russian aerospace warfare (Cooper, 2019).

The Okhotnik's design is centered on stealth and aerodynamic efficiency, featuring a blended wing-body (BWB) configuration similar to the US B-2 Spirit. This structure, combined with radar-absorbent materials (RAM), concealed intakes, and a flat exhaust nozzle, minimizes radar and infrared signatures. The aircraft spans approximately 20 meters in width and 14 meters in length, with a takeoff weight of around 20 tons, making it one of the largest and heaviest UCAVs ever built. Its shape and construction enable high endurance and low observability during strategic and tactical missions.

Technologically, the S-70 integrates AI-based autonomous flight systems, sensor fusion technology, and secure data links for coordination with
