6.5.2.5 TAI Anka-3 – 2023

The TAI Anka-3 represents Turkey's next-generation stealth unmanned combat aerial vehicle (UCAV), developed by Turkish Aerospace Industries (TAI) as part of the country's expanding autonomous defense ecosystem. Officially unveiled in 2023, the Anka-3 is designed to complement manned fighters such as the Kaan (TF-X) and F-16, while enhancing Turkey's network-centric warfare capabilities. This UAV signifies a major step in the transition from medium-altitude, long-endurance (MALE) drones like the Anka-S and Akinci, toward a stealth-oriented, AI-enabled combat platform capable of performing offensive, reconnaissance, and electronic warfare (EW) missions in contested environments (Caloianu, 2023).

The Anka-3's design features a flying-wing configuration, optimized for stealth and aerodynamic efficiency, with a wide-span delta-like airframe and internal weapon bays to minimize radar cross-section (RCS). Constructed primarily from advanced composites and radar-absorbent materials (RAM),
