9.8.4 Indian Army – SWARM-100 Initiative

The SWARM-100 initiative of the Indian Army represents one of the most significant steps in advancing indigenous autonomous swarm warfare capabilities in South Asia. First demonstrated publicly during the Army Day Parade in 2021, the system consists of a coordinated group of 100 autonomous unmanned aerial vehicles, operating together as a distributed and resilient combat formation. Designed through collaboration between the Indian Army and domestic defense innovation startups, SWARM-100 reflects a shift from traditional single-UAV missions to collective, network-based autonomous operations.

The swarm is capable of performing a variety of mission profiles, including surveillance and reconnaissance, precision strikes using small explosive payloads, logistic resupply of critical materials, and decoy or distraction operations intended to overwhelm enemy air defenses. Each
