Figure 9.8 illustrates a conceptual rooftop vertiport designed for urban air mobility operations. The layout includes a dedicated landing and takeoff pad for eVTOL passenger drones, a fast-charging or battery swap zone to support rapid turnaround time, a passenger boarding/safety-check area, and an elevator or transit access point connecting the vertiport to ground transportation networks. A centralized control hub coordinates arrival sequencing, clearance, and communication with city UAM traffic management systems. This configuration enables seamless, safe, and efficient multimodal transport integration within a smart-city air mobility framework.
