9.8.13 N okia Drone Networks – automated surveillance and emergency response in Europe

Nokia’s Drone Networks platform represents one of the most advanced examples of integrated, automated drone operations deployed for public safety, industrial monitoring, and emergency response across Europe. The system combines 5G/LTE private networks, autonomous drone docks, high-definition sensors, and an AI-enabled control platform to allow drones to be launched, flown, monitored, and recovered remotely, without an on-site operator. This model shifts drones from being manually piloted tools to networked aerial assets functioning as part of a continuous surveillance and incident-response infrastructure.

The drones operate from weather-protected docking stations, where they can automatically charge, upload data, and receive updated mission
