the need for an onsite operator. Real-time video and telemetry streams are transmitted to a centralized command center, allowing rapid situational awareness and coordinated emergency response. This network-integrated system supports continuous monitoring of critical infrastructure, urban environments, industrial facilities, and disaster zones across Europe.

9.8.14 India 5G BVLOS drone trials for medical and agricultural delivery

India has undertaken significant national-level initiatives to integrate 5G connectivity with beyond visual line of sight (BVLOS) drone operations, particularly in the fields of medical logistics and precision agriculture. These trials have been supported through collaborations between the Telecom Regulatory Authority of India (TRAI), Department of Telecommunications (DoT), DGCA, and multiple private drone manufacturers and telecom providers. The primary goal of these trials is to establish reliable long-range drone operations capable of serving remote, rural, and hard-to-reach regions where traditional transportation infrastructure is limited.
