ADDING BORDER

Gridlines surround each cell in a worksheet. These lines are not printable by default, which means they are there to guide you when entering data.

You will need to apply borders around your cell or range of cells to make them visible when you print.

Excel provides you with the option to frame a group of cells with vertical or horizontal lines, known as cell borders, for a variety of reasons such as emphasizing data, improving the spreadsheet's appearance, and organizing data for better viewing. Borders can be added to a single cell or a range of cells, with various types available, including solid, dashed, or double lines. Moreover, you can also modify the thickness and color of the border to enhance the visual appeal of your worksheet.

To add a border to a range of selected cells, go to the **Home** tab, move to the **Font group**, and click on the drop-down arrow beside the **Border** command icon, as illustrated below.
