WRAP TEXT

The Wrap Text command enables you to present lengthy text in a cell across multiple lines, making it easier to read.

Enabling the Wrap Text feature will adjust the cell's height to accommodate multiple lines of text instead of displaying a single, long line that exceeds the cell's space. By doing so, your data becomes more understandable and readable. Nonetheless, applying the Wrap Text feature will increase the height of all cells in that row, potentially resulting in a slightly unusual appearance for your worksheet.
