INSERTING AND DELETING ROWS AND COLUMNS

The Excel ribbon method is one of three methods to insert rows or columns in a worksheet. The first thing you need to do when you want to add new rows in an Excel worksheet is to highlight the row or rows above or below where you want to add the new rows.

You can select multiple rows by clicking and dragging the mouse over the row numbers or use the arrow keys to select multiple rows by holding the shift key while clicking and dragging the mouse over the row numbers.

On the Home tab, click the **Insert** button under the **Cells** group.

Choose the **Insert Sheet Rows** option from the drop-down menu that appears.
