For row height, after making your row selection, move the cursor to the **bottom border**, and the cursor shape will turn into a vertical resize cursor.

Using the left mouse button, click and hold down the button, and then drag the border of the cells to the **left** or **right** to adjust the **column width**.

Move the **vertical resize cursor** up or down to adjust the **row height**.

Then again, you can alter selected cells' column width and row height by going to the **Home** tab and clicking the **Format** command in the **Cells** group on the Excel ribbon.

1. Select the cells whose row width or column height you want to change.
