HIDING AND UNHIDING EXCEL ROWS AND COLUMNS

You may use the **Hide** feature in the ribbon to conceal specific row(s) or column(s) in Excel. This will render the selected row(s) or column(s) invisible to anyone viewing the worksheet. This tool is handy when dealing with large spreadsheets. It allows you to concentrate on a specific data set or temporarily mask particular row(s) or column(s) without completely deleting them from view.

If you want to **unhide** hidden row(s) or column(s), you can use the **Unhide** feature to make them visible again. The contents of the row(s) or column(s) will now be accessible; you can see and reaccess them.

Follow these steps to hide rows or columns in an Excel spreadsheet

1. Select the rows or columns you want to hide by clicking and dragging the mouse cursor over the row or column headings.
2. Right-click one of the selected rows or columns, and select **Hide** from the context menu.
