BASIC STRUCTURE AND SYNTAX OF EXCEL FORMULAS

The basic structure of an Excel formula is as follows:

= [operand1] [operator] [operand2]

The equal sign (=) in this structure indicates that the cell holds a formula.

The **operands** are the values or cell references that the excel formula runs on, and the **operator** is the symbol that signifies the mathematical calculation to be done.

Operators in a formula are a crucial part of all of the computations that Excel performs on a Workbook. The ability to understand them is essential if you want to understand formula behavior and solve problems that arise.

Formulas in Excel can be written using several kinds of operators. These include:

- **Mathematical Operators**: These operators perform basic mathematical calculations, such as addition, subtraction, multiplication, and division. Examples of mathematical operators in Excel include:

  + for addition - for subtraction

  ***** for multiplication **/** for division

For example, the following Excel formula uses the Mathematical operators;
