

	A	B	C	D	E
1	**Category A**	**Stock**	**Purchase Price**	**Selling Price**	**Profit or Loss**
2	Beverages	2,000	$250.00	$300.00	=D2-C2

To do this, you enter the formula **=D2-C2** in cell **E2**.

This formula will subtract the value in cell **C2** (the **Purchase price** of that particular stock) from the value in cell **D2** (the **Selling Price** from Beverages in row 2).

This formula will give you a **Profit or Loss** of **$50** for Beverages.

	A	B	C	D	E
1	**Category A**	**Stock**	**Purchase Price**	**Selling Price**	**Profit or Loss**
2	Beverages	2,000	$250.00	$300.00	$50.00
3	Condiments	4,000	$350.00	$420.00	
4					

Instead of entering the formula separately for each cell in the worksheet, you can copy or drag-fill (using the fill handle) the formula from cell **E2** and paste it into all the other cells in the worksheet (in column **E**). Upon doing that, you will notice that the reference to the cell automatically adjusts to refer to the row in which it belongs.
