

The formula for cell **E3**, for instance, becomes **=D3-C3**, giving you a **Profit or Loss** of $70 for Condiments.

Using **Relative cell references** in Excel allows you to create formulas and functions that are flexible and dynamic, giving you the ability to perform mathematical calculations.

On the other hand, the **absolute cell references** do not change when you copy the formula to other cells, unlike relative cell references.

Let's say you have this data set with the total sales for each item, and you have to figure out the commission.
