The reference to cell **F1** is absolute because it is **anchored** to that **specific** cell, regardless of where the formula is copied into.

Drag and fill the formula to copy it into the other cells along the same column.

The cell reference to cell **F1** will remain unchanged, while the reference to column **D** will be adjusted relative to the new cell location.

Therefore, the formula in cell **E3** would become:

=D3*F1
