REFERENCING A CELL IN ANOTHER WORKSHEET

The format used to create a formula that refers to another sheet in the same workbook is as follows:

Sheet_name!**Cell_address**

It starts with the **Worksheet name**, followed by an **exclamation mark**, and then the **cell reference**.

Here is how you refer to cell **A2** in **Sheet 1**:

=Sheet1!A2

Here is how to refer to a range of cells in another sheet:

Sheet_name!First_cell:Last_cell

Here is how to refer to the range **A2:C5** in another sheet in the same workbook:

=Sheet1!A2:C5

In the illustration below, you can see only the reference to the cell or the range, not the actual data.

There would be a time when you would need to use these in formulas.

As far as the format of the references mentioned above goes, they will be the same always.

The worksheet you refer to would likely have multiple words in the name. For instance, the worksheet may be named **Site data** or **Supply data**.
