DEFINITION OF EXCEL FUNCTIONS

Excel functions are a set of **pre-defined formulas** that can complete a range of calculations or tasks within a Worksheet. They are a vital component of Microsoft Excel and are used to speed up tasks and minimize spreadsheet management and data analysis mistakes.

In Excel, a formula is an expression that works with values in one or more cells. For example, the formula =**E2+E3+E4+E5+E6** calculates the sum of the values in cells **E2** through **E6**.

Functions in Excel quickly perform calculations without having to enter the formulas manually. They are given **human-readable names** to make them easier to understand.

For example, the function =**SUM(E2:E6)** calculates the sum of the values in cells **E2** through **E6**.

	A	B	C	D	E	F
1	**Items**	**Quantity**	**Unit Price**	**Amount**	**Commision**	15%
2	Keyboards	20	$19.00	$380.00	$57.00	
3	Chairs	2	$100.00	$200.00	$30.00	
4	Tabels	3	$140.00	$420.00	$63.00	
5	Scanners	13	$135.00	$1,755.00	$263.25	
6	Printers	15	$199.00	$2,985.00	$447.75	
7					=sum(E2:E6)	
8						

Functions can save time and reduce the risk of errors when working with formulas in Excel.

Hundreds of Excel functions are available, each with a particular purpose, such as the SUM, AVERAGE, MAX, MIN, and IF functions. Other types of
